March 2007

New catalogue from Fuel Parts UK

Company launches brand-new printed engine management document

Fuel Parts UK, a market-leading manufacturer and supplier of fuel and emissions components, has taken the wraps off its brand-new printed engine management catalogue, boasting 350 new references and giving in excess of 90% coverage of the UK vehicle parc.

The new 201-page document – which includes both petrol and diesel engine management products – features air temperature sensors, cam sensors, crank sensors, EGR valves, engine speed sensors, gear box sensors, idle air valves, knock sensors, mass air flow meters, map sensors, fuel pressure regulators, throttle potentiometers and coolant temperature sensors.

The black and white catalogue presents a total of 1786 references and features bespoke product sections that will be invaluable to stockists and technicians alike as they explain what certain products do, their failure symptoms and what service maintenance is required when this happens.

Fuel Parts UK managing director, Paul Tomlinson, said: "The success of our 'EMS – The Way Forward scheme' shows that we are very serious about the engine management side of our business and the fact that we go to great lengths to make sure any new stockists receive the full support and guidance that they may require.

"We've already attracted well in excess of 100 new engine management customers since we launched the scheme and I think this comprehensive catalogue will help to give those people even more confidence in their offering and hopefully reassure those that may be considering getting involved in the future."

To obtain a copy of the new Fuel Parts UK printed engine management catalogue, professionals are asked to either contact Sue Wood on 01527 839344 or complete a catalogue request form that can be found in the engine management section of www.fpuk.co.uk.
